21. Bootstrapping Regression Models. Bootstrapping is rapidly becoming a popular alternative tool to estimate parameters and standard errors for logistic regression model (Ariffin and Midi, 2012 [2]). Fitrianto and Cing (2014) [3] asserts that logistic regression is a popular and useful statistical method in modeling categorical dependent variable.

The bootstrap is a computer-based statistical technique that is used to obtain measures of precision of parameter estimates. Although the technique is sufficiently general to be used in time-series analysis, permutation tests, cross-validation, nonlinear regression, and cluster analysis, its most common use is to compute standard errors and confidence intervals.

We focus here on the bootstrap approximation to the distribution of the least-squares estimator for such class of regression models. We compare and discuss the results on both the classical and bootstrap confidence intervals through an intensive simulation study.
