Electronic distance measuring instrument is a surveying instrument for measuring distance electronically between two points through electromagnetic waves. Electronic distance measurement (EDM) is a method of determining the length between two points, using phase changes, that occur as electromagnetic energy waves travels from one end of the line to the other end.

Electronic Distance Measurement (EDM) is a fundamental feature of modern surveying Total Stations. Distance measurements can be made in two modes: [1] with a reflector using an Infrared or visible laser electromagnetic wave and phase measurement or [2] 'reflectorless' using a visible laser beam and pulse time of flight.

Notes on Electronic Distance Measurement

An Electronic Distance Measurer (EDM) can be used to place objects or points in three dimensions in relation to the unit. The EDM emits a beam of infrared light that is modulated at a controlled rate. During use, the light beam is emitted from the EDM, reflected off a prism or target held at a point to be mapped, and bounced back to the EDM.

Electronic Distance Measurement (EDM) - Report

Electronic sensors can detect everything from light to distance to acceleration. Sensors are how a product senses anything in the real-world, and there is an almost endless array of them available. Sensors measure real-world quantities, which are then converted into an electrical signal.
