Modern portfolio theory (MPT), or mean-variance analysis, is a mathematical framework for assembling a portfolio of assets such that the expected return is maximized for a given level of risk. It is a formalization and extension of diversification in investing, the idea that owning different kinds of financial assets

The traditional mean-variance analysis of Markowitz has many weaknesses when applied naively in practice. They include: 1. The tendency to produce extreme portfolios combining extreme shorts with extreme longs. As a result, portfolio managers generally do not trust these extreme weights.
